# Introduction

Welcome to your comprehensive guide to becoming certified in OneTrust's Enterprise Policy Management capability. OneTrust is the leading global software to operationalize data privacy, tech risk, & compliance.

OneTrust's web-based platform provides end users the ability to create policy records, collaborate on the drafting of policy content, configure required approvals at necessary stages, and distribute policies using a variety of methods.

The result of using this powerful tool is that an organization can create a comprehensive Policy Library, document employee attestations, and streamline the ongoing management of their standards, procedures, and policies. This not only assists end users in remaining up-to-speed with the standards & frameworks their company adheres to but also fosters a culture of continuous improvement.

# Resources and Support

## Technical and Partner Support

- Partner Representatives are the first point of contact for partners
- Navigate to https://my.onetrust.com/s/contactsupport for technical and support cases
- To contact sales, email sales@onetrust.com

## Training and Certifications

- View program information and upcoming session dates at www.onetrust.com/certifications
- For general inquires and questions, submit a case by selecting **Certification Program** at https://my.onetrust.com/s/createcase

## My.onetrust Resources

Customers and partners can access my.onetrust.com for additional resources such as:

- OneTrust knowledge
- Release notes and developer portal
- Maintenance and live system status

# Overview

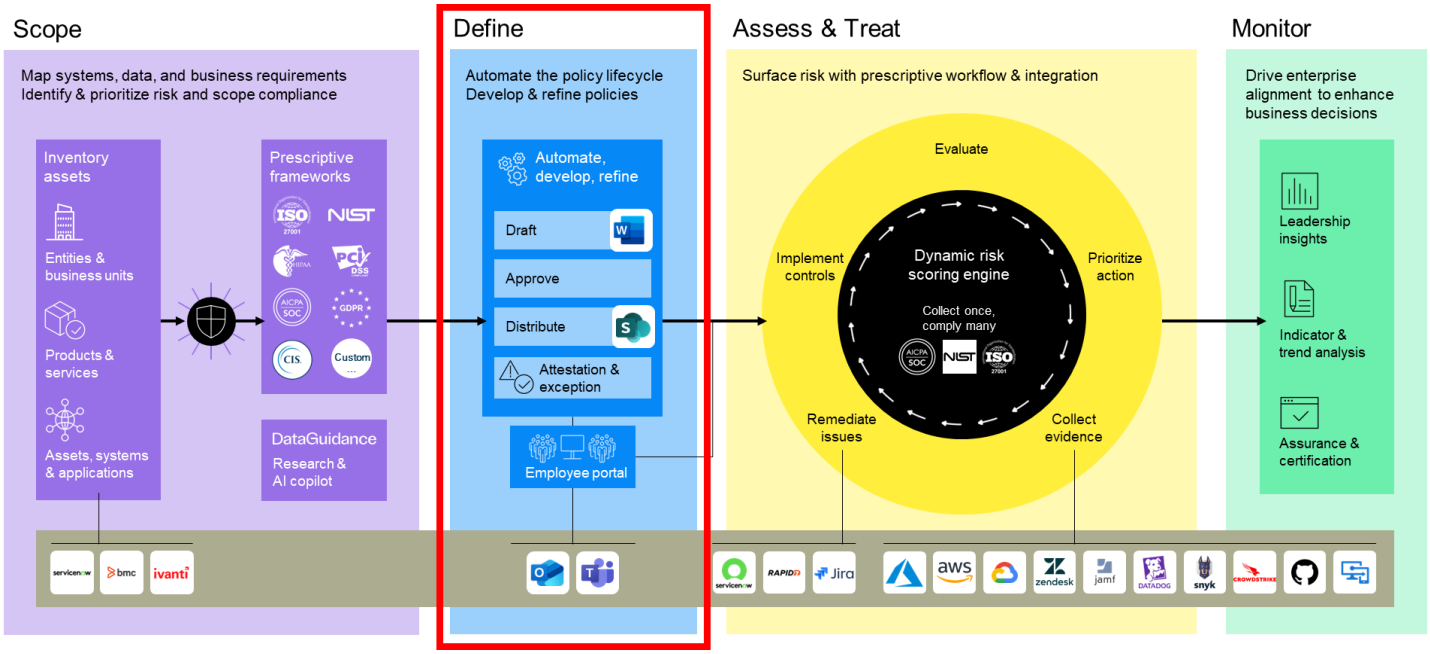

- Portrays where the Enterprise Policy Management capabilities in the OneTrust Platform fit into the larger scope of the Tech Risk & Compliance solution.
- Defines, compares, and contrasts the nuances of key terminology used in the Enterprise Policy Management capability.
- Breaks down the importance of policy use beyond compliance.
- Provides a high-level overview of the policy management lifecycle.

## Learning Objectives

- Compare and contrast policies, standards, and procedures.

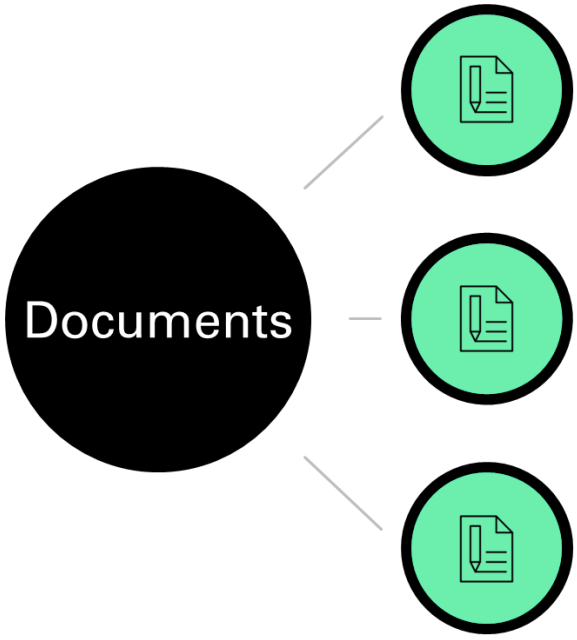

# An Overview of Enterprise Policy Management

## Where Enterprise Policy Management “Fits In”

The pictured flow was reviewed in detail in the Solution Overview course and shows how several capabilities work together to streamline a tech risk & compliance program. This course, Enterprise Policy Management, will be focused on the boxed section and will teach how to draft, manage, approve, distribute, and collect attestations for policies.

## Key Terminology

### Policies

A high-level statement of management intent that formally establishes requirements to guide organizational decisions.
*Example: Acceptable Use Policy*

### Standards

An objective and quantifiable expectation that formally establishes requirements regarding a process, action, or configuration within an organization. Standards define specifications, guidelines, or best practices expected.
*Example: Strong Password Configuration*

### Procedures

A living document that describes a process and updates based on changes to the organization, technology, and staffing. Procedures define how a policy should be applied within the organization.
*Example: Implementing Strong Password Configuration*

While the graphic above provides definitions to three main vocabulary words that are important to OneTrust's Enterprise Policy Management capability, there are couple concepts to keep in mind:

1. These three terms are very similar to one another, but understanding the small differences between them is important. OneTrust provides the ability to both document and build content for each of these terms as well as relate them to one another. These three documents are interconnected in an organization and those connections can be represented within the OneTrust Platform.
2. "Documents" in OneTrust can have a couple of different meanings. "Documents" can often refer to attachments on various records in OneTrust, such as inventory objects or risks. The second meaning is what's shown above: a collective reference to all three terms. It's important to understand the context of what's being discussed when hearing the word "documents."

## Policy Importance

There are two main questions that can be answered to explain why policies are so important:

1. **What do policies do?**

> Policies clarify the expected output & behavior of an organization's members in the context specific to that organization.

In other words, policies allow organizations to specify ideal results and how these goals should be reached. Not all policies are applicable to an entire company, so each is written with a specific audience in mind.

2. **Why do we need policies?**
    a. Aid in the simplification of processes

Policies can ensure that a certain goal is accomplished in a streamlined manner, no matter who is tasked with the effort.

    b. Guide daily workplace activities

Guidance ensures that this streamlined effort is accomplished with consistency. Repeatability is crucial to ensure that the risk of falling short of a desired outcome is minimized.

    c. Promote compliance with laws & regulations

The GDPR's Article 25 focuses on privacy by design and default. At a high level, this article states that when in the *design* phase of a project, privacy compliance should be kept in mind. This will ensure that once that project launches, privacy compliance is maintained by *default*. Compliance doesn't stop at the GDPR, and this same thought process can be applied when drafting policy content for any regulation, standard, or framework that your company is adhering to.

    d. Provide strategic viewpoint for decision making

Because policies specify an expected end goal, they can offer a different perspective for better decision-making when obstacles are met.

## Policy Management Lifecycle

When using the Enterprise Policy Management capability in OneTrust, all policies will follow this high-level management lifecycle:

1. **Develop**

First a policy will be developed. In OneTrust, this means that a policy record will be created, its content drafted, and approvals provided via configured workflows.

2. **Publish**

Published policies have even more features in OneTrust. A published policy can be exported as a PDF, added to the Policy Library, and distributed to targeted individuals. Attestations can also be configured gather user confirmation that they've read and understood the content.

3. **Monitor**

The work doesn't end after a policy is published, read, understood, and attested to. Detailing where a policy was and wasn't successful is pertinent. Automated follow-ups, dashboards, and reports are just a few of the tools that OneTrust provides to assist in making these determinations. Once enough data has been collected, a new version of that policy can be created and the lifecycle repeats.

# Exercises

- Better represent your business processes by using OneTrust to streamline the creation, relation, and population of policy records and content.
- Enhance ongoing collaboration and management by configuring custom workflows that align with the standards & frameworks to which your company adheres.
- Use OneTrust's Policy Library, share links, and attestation settings to distribute and collect evidence that users have read and understood policy content.
- Maintain open and clear communication by configuring OneTrust automation rules to automatically notify key stakeholders of important upcoming dates.

## Learning Objectives

- Configure and relate a new policy record in OneTrust to key inventory objects and documents.
- Draft policy content & approve with key stakeholders.
- Demonstrate how policies can be distributed using multiple methods.

# Exercise Process

## Enterprise Policy Management Flow

There are five overarching steps when using OneTrust's Enterprise Policy Management capability:

1. **Policy record collection**

End users start by creating records of their policies within OneTrust. These records are what allow for collaboration, relationship representation, content building, and distribution of policies.

2. **Policy build and collaboration**

There are several tools within the OneTrust Platform that allow for thorough collaboration. These tools include sections for uploading key attachments, relating controls, issues, and inventory objects, drafting policy content, configuring workflow approvals, and more.

3. **Approvals and publication**

All policies will progress through a series of stages referred to as a workflow. These workflows can be configured to meet a company's compliance needs regarding when and by whom a policy is approved.

4. **Distribute**

After publication, a policy can be added into OneTrust's policy library, configured to require attestations, exported as PDFs, and have generated share links to embed in company intranets or other documents.

5. **Additional / ongoing management**

OneTrust provides many tools to manage policies over time, including an attribute manager, policy and policy section templates, and automation rules.

# Policy Record Creation

## Policy Record Creation Methods

The first step of the Enterprise Policy Management flow spoke to the importance of creating policy records. Having policy records in OneTrust allows users to organize their policies and collaborate with a wide variety of tools, including a builder where policy content will be drafted.

There are 3 ways to create policy records in the OneTrust Platform:

1. **Manually** – Users can add policies, populate details, and update drafts directly in OneTrust's user interface.
2. **Pre-built templates –** OneTrust provides pre-built policy templates that users can use to get a head start on drafting policy content.
3. **Integration** – Public API integrations can be used to both create policy records in OneTrust as well as populate attributes and content.

## Create a Policy Record

In order to manage policies within OneTrust, that policy must first be represented by a policy record. While there are a few methods to create this record in the platform, this exercise will walk you through how to use OneTrust-provided templates to streamline the content building process.

**Exercise importance:**

- Allows for collaboration using a variety of managerial tools
- Associates the policy with a workflow to determine when approvals are required
- Provides end users the capability of building policy content

### Detailed Exercise Steps

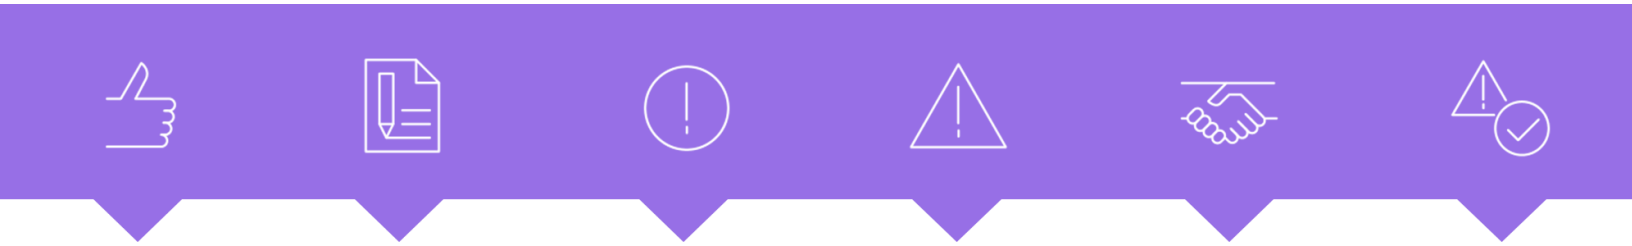

Step 1: Click on the **launch pad** at the top left of the screen
Step 2: Click on the **Enterprise Policy Management** option
Step 3: Click the **Policies** tab on the left side of the screen
Step 4: Click the **Create policy** button at the top right of the screen
Step 5: Select the **Choose from templates** option then click **Next**
Step 6: Click the **Choose from gallery** button in the top right corner
Step 7: In the **search bar**, type **"use policy"**
Step 8: Hover over the **Acceptable Use Policy** tile and click the **Preview** button
Step 9: Scroll through the contents then click the **Choose policy** button at the bottom right
Step 10: For **Policy name**, type **"Acceptable Use Policy"**
Step 11: For **Managing organization**, select **the top-most organization**

Step 12: Select "**Assign to me**" for both the **Policy owners** and **Policy approvers** boxes
Step 13: Use the **calendar tool** to select an **Effective date** for **3 months from today**
Step 14: Click the **Create** button at the bottom right of the menu

# Policy Management & Building

## Collaboration Tools

OneTrust provides many tools on a policy record for the collaboration, management, and building of policy content. These tools include:

### Workflows & approvals

Determines the stages the policy record follows before it's in effect. Approvals are configured into the stages.

### Documents

Allows users to upload important attachments to the policy record.

### Controls

Shows relationships with controls from standards & frameworks in the Control Library.

### Related & Issues

Provides insight into which inventory objects, standard, procedures, issues, and more are related to this policy.

### Attestations

Where configured attestations associated with this policy would be shown to easily see statuses.

### Exceptions

Policy exceptions can be created directly on the policy record or through the self-service portal.

The next exercises will detail the importance and processes of:

1. Relating policies to controls and inventory objects
2. Building custom policy workflows, and
3. Building policy content

# Associate Policies with Controls & Inventory Objects

This exercise will demonstrate a couple of the managerial tools available with policy records. First, you'll associate the policy created in the previous exercise with controls to document how the policy is being enforced. To then specify what this policy impacts, you'll relate the policy to an inventory object. While you won't relate this policy to multiple inventory types or objects, it is possible to do so.

**Exercise importance:**

- Associating controls shows how various policies are enforced
- Relating policies to inventory objects streamlines navigation and better represents enterprise environments

## Detailed Exercise Steps

**Part 1 – Add controls to the policy:**

Step 1: Click on the **Controls** tab for your newly created policy at the top middle of the screen
Step 2: Click the **Add control** button in the center of the screen
Step 3: For **Standard/Framework**, select **ISO/IEC 27001:2013 (27002)** on the left side of the menu
Step 4: In the **search bar** at the top right, type **A.9**
Step 5: Check the box for **A.9.1.1 Access Control Policy**
Step 6: Click the **Add** button at the bottom right of the menu

**Part 2 - Relate the policy to an asset**

Step 7: Click on the **Related** tab for that policy
Step 8: Scroll down and click the **Add related asset** button
Step 9: Click on **Choose asset** and select an **Asset of your choice**
Step 10: Click the **Add related** button

# Create a Custom Policy Workflow

During the last exercise you may have noticed a series of steps across the top. These stages together detail a policy workflow. These workflows can be customized to a business needs. Automations, required approvals, new stages, and more can be configured within these custom workflow. This exercise will demonstrate this configuration process.

**Exercise importance:**

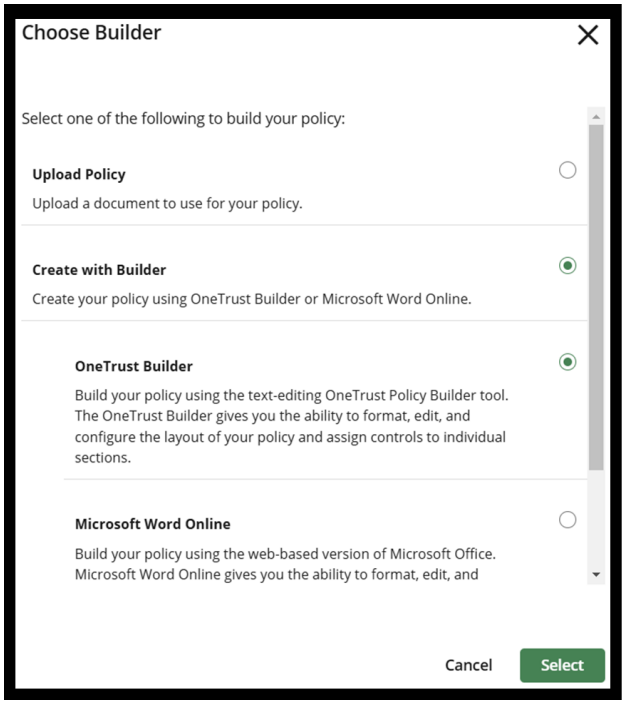

- Allows organizations to tailor their policy management to the standard requirements they need
    - A main benefit includes adding approval stages throughout policy's lifecycle

## Detailed Exercise Steps

Step 1: Click the **Workflows** tab on the left menu and select **View** for **Policy workflows**
Step 2: Click the **Create workflow** button in the top right corner
Step 3: **Name** the workflow "**Policy approval workflow**"
Step 4: Click the **Create button**
Step 5: Click the **plus (+) button** between the In development and In use stages
Step 6: For **Stage title**, type "**Under review**"
Step 7: For **Badge color**, select "**Under review**"
Step 8: Toggle **on** the **Set as approval stage setting**
Step 9: In the **Approvers** section, set the left box as "**User attribute**" and the right box as "**Policy approvers**"
Step 10: Click the **Add** button
Step 11: Select the **In use stage** across the top
Step 12: Click the **Stage rules** tab and click **Create rule**
Step 13: **Name** the rule "**Annual Return to In Development**"
Step 14: In the **Actions** section, select "**Route based on document expiration date**"
Step 15: In the **Next workflow stage** section, select "**In development**"
Step 16: In the **Value** box, type "**3**"
Step 17: In the **Select a value dropdown**, select "**months before**"
Step 18: Click the **Save** button in the bottom right
Step 19: Click **Activate** in the top right and **Activate workflow** on the pop-up window

## Content Building Methodologies

Now that the policy record has been built, workflows with approvals configured, and collaboration has begun, the actual policy content needs to be detailed. There are several methods that can be used to do so:

### Upload a policy

Policies built in other systems can be uploaded as a document in OneTrust to manage.

### OneTrust builder

Policies can be organized and built directly in the OneTrust Platform's user interface.

### Microsoft Word online

Policies can be built in the web-based version of Microsoft Word.

### Pre-built templates

If a pre-built template is used, the OneTrust Builder is automatically available and populated with base content for editing.

# Build Policy Content

You've created a new policy record, customized and workflow, and have become familiar with a few of the managerial tools. But what does this policy say? This exercise will show how the policy's content can be updated and published.

**Exercise importance:**

- Specifies how the policy should be followed to desired audiences.

## Detailed Exercise Steps

Step 1: Click the **Policies** tab on the left menu
Step 2: Select your newly created **policy record** from the list
Step 3: Click the **Draft version** hyperlink on the right in the **Policy builder** section
Step 4: Update the **[COMPANY] text** to read as **your own company (or "OneTrust")**
Step 5: Click the **Publish** button in the top right
Step 6: Click the **Confirm** button in the middle

# Policy Distribution

## Methods of Policy Distribution

After a policy has been drafted and approved, it needs to be available to the audiences in need of the details. Depending on the standards & frameworks that an organization adheres to, requirements around policy availability and distribution can differ. Some policies just need to be made available for ad-hoc access while others require a confirmation (or attestation) of individuals having read and understood the content. Because of these differences, OneTrust provides a few methods of policy distribution. These include:

| 01. | 02. | 03. |
|---|---|---|
| Share links | Policy library | Attestations |
| Generates a link to the published policy that can be embedded in:<br>• Other OneTrust documents<br>• Intranets/Communications | Policies added to the OneTrust Policy Library can be easily accessed by users on-demand when necessary. | Policies in the library can be configured to require a user's attestation. User attestation details can then be viewed in the EPM capability. |

## Generate & Use a Share Link

Our policy content is published and ready to go. The first method of distribution that this exercise will demonstrate is how to generate a share link. Share links can be embedded in emails, intranets, and other documents. In this exercise, you'll practice this effort by embedding a share link within a standard.

**Exercise importance:**

- Share links can be generated in OneTrust to embed in company intranets, communications, or other documents, such as standards and procedures.

### Detailed Exercise Steps

**Part 1 – Generate a share link:**

Step 1: Click into the **Policy** that was published in the previous exercise
Step 2: Click the **Share** button in the top right
Step 3: Keep **Access level** as "**Anyone with the link**"
Step 4: Click the **Generate share link** button
Step 5: Click the "**Copy to clipboard.**" button (icon of 2 pages on top of each other) that appears and close out of the pop-up window

**Part 2 – Embed the share link in the standard**
Step 6: Click the **Standards** tab on the left menu
Step 7: Select the **Strong Password Policy standard** on the list
Step 8: Open the **draft** on the right side in the **Standard builder** section
Step 9: **Highlight** "**Acceptable Use Case policy**" in the Standard's Password Requirements section
Step 10: Click the **Insert link** button (the chain icon)
Step 11: Paste the **share link** in the **URL** field
Step 12: Click **Insert**
Step 13: Click the **Save** button in the top right corner
Step 14: Click the **Publish** button
Step 15: Click the **Confirm** button

## Configure & Test a Policy Attestation

While share links are convenient, they are unable to track who has or has not read a policy. This exercise will show a couple of other distribution methods. First, you'll add your policy to the Policy Library. If you wish for a policy to be available on an ad-hoc basis, this is where you would end the steps. If you require confirming whether people have read the policy, however, this exercise will continue to show how to configure, provide, and review attestations.

**Exercise importance:**

- Attestations can be configured to track which users have confirmed that they've read and understood a policy's content.

### Detailed Exercise Steps

**Part 1 – Add the policy to the policy library:**
Step 1: Select the **Policies** tab on the left menu
Step 2: Click into the **Policy** you created
Step 3: Click the **context button (…)** in the top right and select **Add to library**
Step 4: Click the **Continue** button on the pop-up window

**Part 2 – Configure, test, and review an attestation**
Step 5: Click the **Attestations** tab (may need to first click the **More** tab)
Step 6: Click the **Create attestation** button
Step 7: **Name** the Attestation "**Acceptable Use Policy**"
Step 8: **Expand** the **Show settings** section
Step 9: Toggle on the **Enforce scrolling on acknowledgement** setting
Step 10: Click the **Create** button
Step 11: Click the **Send** button
Step 12: Select the **All users** tab on the left

Step 13: Check the box for **your user**
Step 14: Click the **Send** button
Step 15: Using the **launch pad**, navigate to the **Self-service portal** in the **General Apps section**
Step 16: In the **My documents** tab in the left menu section, click the **Attest** button for the **Policy**
Step 17: **Scroll** to the bottom, **check** the box, and click **Submit**
Step 18: Navigate back to the **Policy** in **Enterprise Policy Management**
Step 19: Click into the **Attestations** tab
Step 20: **Click** the configured **attestation** to see the **results** of our confirmation

# Exceptions

## Overview

Policy exceptions can be documented and managed in a centralized location called the Exception Register. These exceptions can be created in three different ways:

1. **Directly on documents**

OneTrust admin can create an exception record directly on a policy, standard, or procedure. This will link the exception to that document and have the exception record appear in the Exception Register.

2. **Directly in the exception register**

OneTrust admin can also navigate this process in the opposite direction by creating a record directly in the register and then associating that exception with the applicable documents.

3. **Requesting an exception via the Self-Service Portal**

End users can request exceptions to policies, standards, and procedures via the Self-Service Portal. Upon submission, an exception request record is created in the exception register for an approver to review.

Similarly to policies, custom workflows can be created to manage exception requests. These workflows can have stages that require and track approvals. For each exception record, key documents can be uploaded, controls can be associated, relationships can be built, and more.

# Request a Policy Exception via the Self-Service Portal

If an individual believes they do not need or should not need to follow a policy, it's important that the admin be able to track these cases and approve when applicable. Exceptions in OneTrust allow for this possibility. This exercise has you flipping back and forth. First, you'll begin by requesting an exception. Then you'll become an administrator to review this request's details.

**Exercise importance:**

- End users can request policy exceptions directly in the Self-Service Portal.
- Policy exception requests create an exception record for approval.
- Users can track the statuses of all their requested policy exceptions.

## Detailed Exercise Steps

Step 1: Click the **launch pad** and navigate to the **Self-service Portal**
Step 2: Click the **My documents** tab on the left menu
Step 3: Select the **My exceptions** tab across the top
Step 4: Click the **Create exception** button
Step 5: Select the **policy you created** in the **Source document** field
Step 6: In the **Reason for exception** box, type a reason

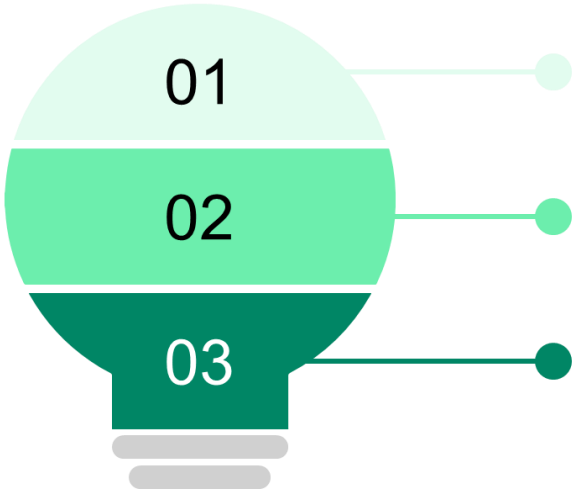

*Example: "Personal email address already being used for company's required third-party certificates. Cannot change email address on that vendor's website."*

Step 7: Use the calendar tool to select today for the **Expiration date**
Step 8: Click **Submit**
Step 9: Navigate back to **Enterprise Policy Management** and click the **Exceptions** tab
Step 10: View how the exception was created in the **exception register**

# Ongoing Management

## Additional Tools

Once a policy's content is written, approved, published, and distributed, the work doesn't stop. Policies can be continuously improved over time to strengthen a compliance program and fill gaps where previous policy drafts have fallen short. OneTrust has many tools to assist with ongoing management. These include, but are not limited to:

### Attribute manager

Allows for the creation of custom attributes for Policies, Standards, Procedures, and more. Once created, these attributes can be populated on the Details tab. A bulk update template can be used to update multiple attributes across policies at once, reducing manual effort.

### Templates

Templates can be built for Policies, Policy Sections, Procedures, and Standards to be used in the future when creating a new document. These will provide base content to not have to start fresh each build.

### Automation rules

Used to automate notifications to policy approvers based on set conditions. A common use case is sending an approval reminder email a few weeks prior to a policy's upcoming effective date.

## Configure an Automation Rule

With so many policies, it's tough to keep up with all deadlines, approvals, and updates. This final exercise of the training will demonstrate how automation rules can assist in staying on top of all of these documents.

**Exercise importance:**

- Automation rules can be used to automate actions to occur in the OneTrust Platform. A main use case, as demonstrated in this exercise, is notifying approvers that a policy's effect date is approaching.

## Detailed Exercise Steps

Step 1: On the left menu, select **Automation rules** under the **Setup** section
Step 2: Click the **Add rule group** button in the top right
Step 3: For **Rule group name**, type **"Policy Rules"**
Step 4: Select **the top-most organization** as the **Organization**
Step 5: Click the **Add** button

Step 6: Click the **Add rule** button
Step 7: Select **Policy** on the rule type drop down
Step 8: Click the **Continue** button
Step 9: For **Rule** name, type “**Policy Reminder”**
Step 10: Select **Daily** as the **Frequency**, click the black arrow to the right, then select a time of day of your choice
Step 11: Under **Conditions**, set the **Trigger** as **Attribute**
Step 12: Select **Effective date** for the **Select attribute** box
Step 13: Select **Equal To** for the **Operator**
Step 14: Add **7** for the **Number** box
Step 15: Keep the **Days before** option
Step 16: Under **Actions**, select **Send approval reminder email** from the drop down
Step 17: Click the **Save** button in the bottom right

# Congratulations on completing this course!

## Thank you for investing your time by learning with the OneTrust team.
